   ö
                                                 cerebrovascular diseases, infections such as acute meningitis, demyelinating diseases including multiple sclerosis, degenerative diseases affecting the cerebral correx including Alzheimer's disease and Pick disease, spinocerebellar degenerations including spinocerebellar ataxias including Friedreich ataxia, and ataxia telangiectesia, degenerative diseases affecting motor neurons including amyotrophic lateral sclerosis, inborn errors of metabolism such as leukodystrophics, toxic and acquired metabolic diseases, including vitamin deficiencies, and neurocutaneous syndromes (phakamatoses) including neurofibromotosis. The present sequence represents a human 23553 sulfatase polypeptide.
                    The invention provides 22438, 23553, 25278 or 26212 human sulfatase polypeptides and polynucleotides. The sulfatase genes and polypeptides are useful for treating disorders involving the brain such as

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        4
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             The present invention describes secreted and transmembrane polypeptides and their polynucleotides. The nucleotide sequences are useful as sources of probes, primers, for chromosome mapping, and for generation of antisense sequences. They can also be used to create transgenic animals. The proteins can be used to treat a variety of diseases and disorders, depending on their function. Diseases that may be treated include blood coagulation disorders, cancers and cellular adhesion adisorders. They may also be used to raise antibodies. AAX33891 to AAX34338, and AAX41685 to AAX41774 represent polynucleotide and polypertide sequence given in the exemplification of the present

                                                                            AAC78458 to AAC78599 represent polynucleotide and EST (expressed sequence tag) sequences which encode secreted or transmembrane PRO polypeptides. The PRO polynucleotides and polypeptides have cytostatic activity. The polynucleotides and polypeptides can be used for detecting the presence of PRO polypeptides in samples, for linking bloactive molecules to cells and for modulating biological activities of cells, using the polypeptides for specific targeting. The polypeptide targeting the polypeptide for specific targeting. The polypeptide targeting the polypeptide pairs provide specific targeting of bioactive molecules to cells. AAC78600 to AAC7887 represent PCR primers and probes used in the isolation of the PRO polynucleotide sequences.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           dog; cat; pig; goat; rabbit; tumour necrosis factor alpha; TNF-alpha; blood; chondrocyte cell; cell proliferation; cell differentiation; colon; adrenal; lung; breast; prostate; rectum; cervix; liver; genetic disorder.

Sequences AAU29024-AAU29328 represent PRO polypeptides of the invention. The PRO polypeptides and their associated nucleic acids can be used to detect the presence of a tumour in a mammal by comparing the level of expression of a PRO polypeptide in a test sample of cells from the animal and a control sample of normal cells, whereby a higher level of expression in the test sample indicates the presence of a tumour in the mammal. Mammals include dogs, cattle, horses, sheep, pigs, goats and rabbits but are preferably human. The polypeptides can be used to stimulate tumour necrosis factor (TMF) alpha release from human blood, when contacted with it. A specific polypeptide can be used to stimulate the proliferation or differentiation of chondrocyte cells. The PRO proteins can be used to determine the presence of tumours and also
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Novel nucleic acids encoding PRO polypeptides, used to diagnose the presence of tumours, such as prostate and breast tumours, in mammals and to screen for modulators of the compounds -

The invention provides 22438, 23553, 25278 or 26212 human sulfatase polypeptides and polypucleotides. The sulfatase genes and polypeptides are useful for treating disorders involving the brain such as cerebrovascular diseases, infections such as acute meningitis, demyelinating diseases including multiple sclerosis, degenerative diseases affecting the cerebral cortex including Alzheimer's disease and Pick disease, spinocerebellar degenerations including spinocerebellar ataxias including Friedreich ataxia, and ataxia telangiectasia, degenerative diseases affecting motor neurons including amyotrophic lateral sclerosis, inborn errors of metabolism such as leukodystrophies, toxic and acquired metabolic diseases, including vitamin deficiencies, and neurocutaneous syndromes (phakamatoses) including neurofibromocosis, and neurocutaneous syndromes (phakamatoses) including neurofibromocosis.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         352
                             Novel human sulfatase polypeptides useful for treating and diagnosing sulfatase-related disorders such as cerebrovascular diseases, acute meningitis, multiple sclerosis, degenerative diseases and tumor
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        262
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       322

The invention relates to polynucleotides encoding novel human proteins or their active domains. The polypeptides, polynucleotides and antibodies raised against the polypeptides are used in a method of treatment of a mammal and prevention of disorders caused by the aberrant protein expression or activity. The polypeptides can be used as molecular weight markers, food supplements, and in antibody production. The polypeptides are used to identify compounds which bind to the polypeptides. Polynucleotides of the invention are used as probes and production of recombinant proteins, and in generating anti-sense DNA or RNA and in gene therapy. Polypeptides of the invention can be used to target drugs to a tumour, in assays to determine biological activity, to raise antibodies/elicit an immune response, to determine quantitative protein levels, as tissue markers, and to isolate receptors or ligands. Polypeptides of the invention may also be useful in treating platelet illoments and/or nerve tissue, wound healing, treating burns, promoting the proliferation, differentiation and survival of stem cells, as a

The present invention describes a recombinant human iduronate 2-sulfatase (IDS). The recombinant IDS is more highly glycosylated than the naturally occurring enzyme isolated from human tissue. The recombinant human IDS can be produced in Chinese Hamster Overy (CHO) cells or in a human cell. The recombinant IDS comprises a fusion protein. It is a morpolysaccharidosis inhibitor and can be used in gene therapy. The recombinant IDS is useful in treating and diagnosing subjects suffering from or suspected of having IDS deficiency disorders, e.g. thunter syndrome (mucopolysaccharidosis type II). The present sequence represents a human sulfatase which is used in comparison with the IDS sequence in an example from the present invention. New highly glycosylated recombinant human iduronate 2-sulfatase (IDS) useful for diagnosing or treating subjects suspected of having or suffering from IDS deficiency disorders, e.g. Hunter syndrome GDYYTHYKCDSPGMCGYDLYENDNAAWDYDNGIYSTQMYTQRVQQILASHNPTKPIFLYI Occhiodoro T, Bielicki J, Clements PR; DB 22; Length 533; Human; iduronate 2-sulfatase; IDS; glycosylated; gene therapy; mucopolysaccharidosis inhibitor; IDS deficiency disorder; Hunter syndrome; mucopolysaccharidosis type II. 47.0%; Score 1415.5; DB 22; Lengt 49.1%; Pred. The invention relates to polynucleotides encoding novel human proteins or their active domains. The polypeptides, polynucleotides and antibodies raised against the polypeptides are used in a method of treatment of a mammal and prevention of disorders caused by the aberrant protein expression or activity. The polypeptides can be used as molyneular weight markers, food supplements, and in antibody production. The polypeptides are used to identify compounds which bind to the polypeptides. Polynucleotides of the invention are used as probes and production of recombinant proteins, and in generating anti-sense DNA or RNA and in gene therapy. Polypeptides of the invention can be used to target drugs to a tumour, in assays to determine biological activity, to raise antibodies/elicit an immune response, to determine duantitative protein levels, as tissue markers, and to isolate receptors or ligands. Polypeptides of the invention may also be useful in treating platelet disorders, stem cell disorders, regenerating bone, cartilage, tendon, ligament and/or nerve tissue, wound healing, treating burns, promoting the proliferation, differentiation and survival of stem cells, as a contraction and survival of stem cells.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          contraceptive, treating estepoporosis and esteoarthritis, anaemia, contraceptive, treating esteoporosis and esteoarthritis, analycrophic lateral Alzheimer's, Parkinson's and Huntington's diseases, amylotrophic lateral sclerosis, stroke, immune deficiencies resulting from bacterial, viral or
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Human; cancer; ulcer; HIV infection; human immunodeficiency virus; antiinflammatory; antiirheumatic; antiarthritic; immunosuppressive; antibacterial; endocrine; cardiant; central nervous system; virucide; anti-HIV; fungicide; antimutagen; cardiovascular; antianaemic; anaemia; antiaggregant; haemostatic; vulnerary; antiulcer; osteopathic; eczema;

The invention relates to an isolated nucleic acid detection reagent capable of detecting 1000 or more genes from Drosophila. The invention is useful in developmental biology and in elucidating cell signalling and cell-cell interactions in higher eukaryotes for the development of insecticides, therapeutics and pharmaceutical drugs. The invention sequences (ABLIG176-ABL30511), expressed DNA sequences (ABLIG175) and the encoded proteins The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published\_pct\_sequences. New isolated nucleic acid detection reagent for detecting 1000 or more genes from Drosophila and for elucidating cell signalling and cell-cell 212 HGS-EIKTPTLDKLAAEGVKLENYYVQPICTPSRSQFITGKYQIHTGLQHSIIRPTQPNC 152 Gaps 34 WILCLLTYGYLSWGQALEEEEEGALLAQAGEKLEPSTTSTSQPHLIFILADDQGFRDVGY LPLDNATLPQKLKEVGYSTHMVGKWHLGFYRKECMPTRRGFDTFFGSLLGSGDYYTHYKC Drosophila; developmental biology; cell signalling; insecticide; 98; Disclosure; SEQ ID NO 18678; 21pp + Sequence Listing; English.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   New isolated nucleic acid detection reagent for detecting 1000 or more genes from Drosophila and for elucidating cell signalling and cell-cell
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          The invention relates to an isolated nucleic acid detection reagent capable of detecting 1000 or more genes from prosophila. The invention useful in developmental biology and in elucidating cell signalling and cell-cell interactions in higher eukaryotes for the development of insecticides, therapeutics and pharmaceutical drugs. The invention discloses genomic DNA sequences (ABLi6176-ABL30511), expressed DNA sequences (ABL16175) and the encoded proteins
                                                                                                                                                                                                                                    430
                                                                                                                                                                                                                                                                                                                                                                                                        526

                                                                                                                                                                                                                                            ïs
                                                                                                                                                                                                                   The invention relates to an isolated nucleic acid detection reagent capable of detecting 1000 or more genes from Drosophila. The invention i useful in developmental biology and in elucidating cell signalling and cell-cell interactions in higher eukaryotes for the development of insecticides, therapeutics and pharmaceutical drugs. The invention discloses genomic DNA sequences (ABL16176 ABL30511), expressed DNA sequences (ABL01840-ABL16175) and the encoded proteins (ABS5737-ABB20022). The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published_pct_sequences.
                                                                                            New isolated nucleic acid detection reagent for detecting 1000~\mathrm{or} more genes from Drosophila and for elucidating cell signalling and cell-cell interactions .
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                FRDVGYHGS-EIKTPTLDKLAAEGVKLENYYVQPICTPSRSQFITGKYQIHTGLQHSIIR 146

polypeptides, and the CDNA (ASA0785-SAS41684) and genomic sequences canceding them. The enzyme polypeptides of the invention may comprise the functional classes of oxidoreductases, transferases, hydrolases, lyases, isomerases or ligases. The sequences of the invention are useful in the diagnosis, treatment, prevention and/or prognosis of a wide range of diagnosis, treatment, prevention and/or prognosis of a wide range of immunodeficiency disorders (e.g. cancer), immunodeficiency disorders (e.g. AlbS) autoimmune disorders (e.g. arthritis), neurological disorders (e.g. atheometry disorders (e.g. phenylketonuria), inflammatory disorders (e.g. asthma), cardiovascular disorders (e.g. atherosclerosis), blood-related disorders (e.g. thempolytia), reproductive disorders (e.g. inflammatory disorders (e.g. inflammatory disorders (e.g. inflammatory disorders (e.g. inflammatory alsorders (e.g. inflammatory alsorders (e.g. inflammatory alsorders (e.g. inflammatory) and alsorders (e.g. inflammatory) and alsorders (e.g. inflammatory) and alsorders (e.g. inflammatory) and alsorders (e.g. inflammatory). Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published\_pct\_sequences. preventing, treating neural, immune system, muscular, reproductive, pulmonary, cardiovascular, renal, proliferative disorders and cancerous 90 DVGYHGSEIKTPTLDKLAAEGVKLENYYVQPICTPSRSQFITGKYQIHTGLQHSIIRPTQ 149 150 PNCLPLDNATLPQKLKEVGYSTHMVGKWHLGFYRKECMPTRRGFDTFFGSLLGS-GDYYT 208 Gaps The present invention relates to the isolation of novel human enzyme Length 128; Novel polypeptides and polynucleotides useful for diagnosing, 20.0%; Score 603.5; DB 22; Length 94.2%; Pred.                                                                                                                                                                                                                                                                                                                                                                                                                              13
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published_pct_sequences.
                                                                                                                                                                                                                                                                                                                           New isolated nucleic acid detection reagent for detecting 1000 or more genes from Drosophila and for elucidating cell signalling and cell-cell
                                                                                                                                                                                                                                                                                                                                                                                                                        capable of detecting 1000 or more genes from Drosophila. The invention useful in developmental biology and in elucidating cell signalling and cell-cell interactions in higher eukaryotes for the development of insecticides, therapeutics and pharmaceutical drugs. The invention discloses genomic DNA sequences (ABLi6176-ABL30511), expressed DNA sequences (ABL16176-ABL30511), expressed DNA
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            ----IYTKAKNGSWAAGYGIWNTAIQSAIRVQHWKLLTG--NPG-YSDWVPPQSFSNL 475

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      The invention relates to a library of DNA fragments of Escherichia coll strains comprising polynucleotides (ABA88577-ABA88729 and ABA89533) and encoded proteins (ABB52459-ABB52914-ABB53094) of nature B2/D+A. The polynucleotides have potential antiinflammatory, antibacterial and immunosuppressive activity as part of pharmaceutical compositions used to treat, pallate or prevent extra-intestinal E collinfections. The polypeptides are useful for determining the phylogenic group of a given E. coli strain. These polypeptides can detect and treat an undesired development of E. coli, particularly an extra-intestinal infection that include systemic and non-diarrhoeal infections such as septicaemia, pyelonephritis and meningitis this is particularly advantageous as bacterial resistance is increasing with the more frequent use of broad spectrum antibiotics.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          a library of DNA fragments of Escherichia coli strains for the phylogenic determination of a given strain comprises polynucleotides of nature 82/D+\ A-
